

# General purpose INPUT - OUTPUT shield for Arduino Yún

#### <u>Features</u>

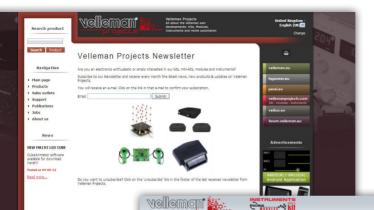

- suited for Arduino Yún
- · requires 1 Arduino Yún (not included)

#### **Specifications**

- · inputs:
  - » 6 analogue
  - » 6 digital
- · outputs: 6 NO/NC relay outputs (1A/30VDC)
- · LED status indicators
- · power supply: 7-15VDC
- dimensions: 80x54mm / 3.15 x 2.12"

#### 1. Assembly (Skipping this can lead to troubles!)

Ok, so we have your attention. These hints will help you to make this project successful. Read them carefully.

#### 1.1 Make sure you have the right tools:

- A good quality soldering iron (25-40W) with a small tip.
- Wipe it often on a wet sponge or cloth, to keep it clean; then apply solder to the tip, to give it a wet look. This is called 'thinning' and will protect the tip, and enables you to make good connections. When solder rolls off the tip, it needs cleaning.
- . Thin raisin-core solder. Do not use any flux or grease.
- A diagonal cutter to trim excess wires. To avoid injury when cutting excess leads, hold the lead so they cannot fly towards the eyes.
- · Needle nose pliers, for bending leads, or to hold components in place
- · Small blade and Phillips screwdrivers. A basic range is fine.

For some projects, a basic multi-meter is required, or might be handy.

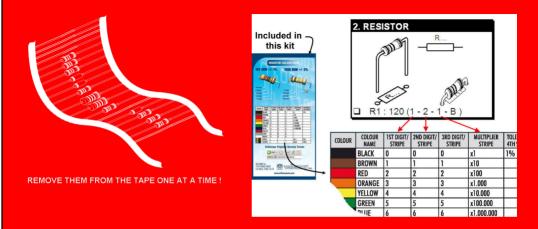

#### 1.2 Assembly Hints:

- Make sure the skill level matches your experience, to avoid disappointments.
- Follow the instructions carefully. Read and understand the entire step before you perform each operation.
- · Perform the assembly in the correct order as stated in this manual.
- Position all parts on the PCB (Printed Circuit Board) as shown on the drawings.
- Values on the circuit diagram are subject to changes, the values in this assembly guide are correct\*.
- · Use the check-boxes to mark your progress.
- Please read the included information on safety and customer service.

\* Typographical inaccuracies excluded. Always look for possible last minute manual updates, indicated as 'NOTE' on a separate leaflet.

#### 1.3 Soldering Hints:

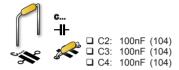

# DO NOT BLINDLY FOLLOW THE ORDER OF THE COMPONENTS ONTO THE TAPE. ALWAYS CHECK THEIR VALUE ON THE PARTS LIST!

# III GENERAL INFORMATION

The I/O shield makes it easy to switch loads and handle digital/analogue signals. The digital inputs and outputs feature an LED that show the status of the port.

#### **DIGITAL OUTPUT SECTION (FIG.1):**

The digital outputs correspond to Arduino lines 8, 9, 10, 11, 12 and 13. Each line drives a relay through a transistor.

Fig.1 Digitial output section

## **DIGITAL INPUT SECTION (FIG.2):**

The digital inputs correspond to Arduino lines 2, 3, 4, 5, 6 and 7, configured as digital input. Protection diodes secure the inputs in case voltages higher than 5 V are applied.

Activate the input by bringing it to a low logic level (GND) (inverse logic).

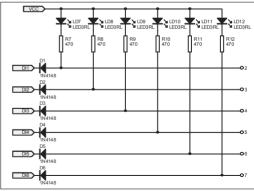

Fig.2 Digitial input section

### **ANALOGUE OUTPUTS (PWM):**

Lines 3, 5 and 6 can be configured as analogue output (PWM, +5 V). With a value between 0 and 255, the duty cycle can vary between 0 and 100 %. Attention: The LED will have an inverse logic in this mode: 0 % duty cycle = LED on, 100 % duty cycle = LED off. All digital inputs have a common ground (GND).

### **ANALOGUE INPUT SECTION (FIG.3):**

Each analogue input (A0..A5) features a series resistor and a protection diode.

The shield requires an external power supply (9-12 VDC). Place jumper JP5V between the central pin and the PWR pin. In this way, the shield as the Arduino Yun are powered by their own power supply.

You can also use the shield with a classic Arduino board, which can be equipped with a power supply. Place the jumper between the central pin and 5 V pin. The Yun does not allow this because of the higher current absorption.

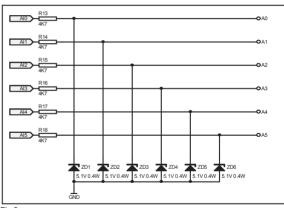

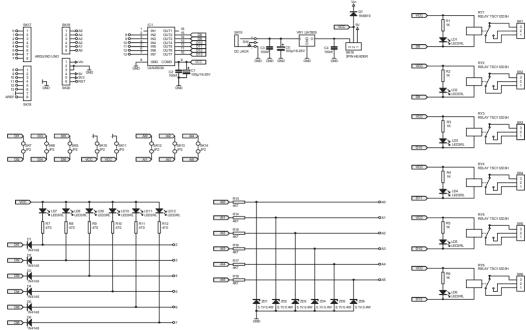

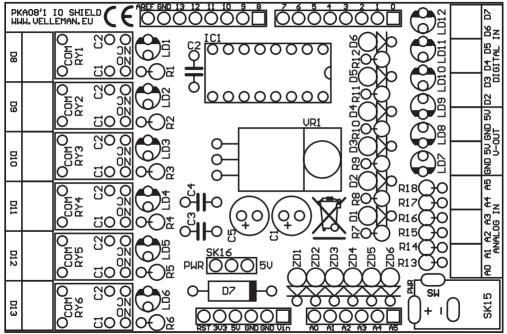

Fig.3 Analogue output section

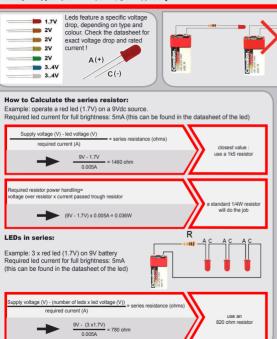

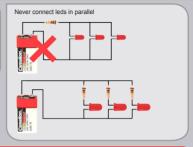

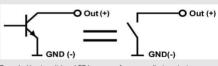

# Leds and how to use them

# open collector outputs

An open collector output can be compared to a switch which switches to ground when operated

Example: How to switch an LED by means of an open collector output
